

From intelligence to action.

A product system for building grounded intelligence and carrying it into the physical world.

NOEMA / UNDERSTANDS

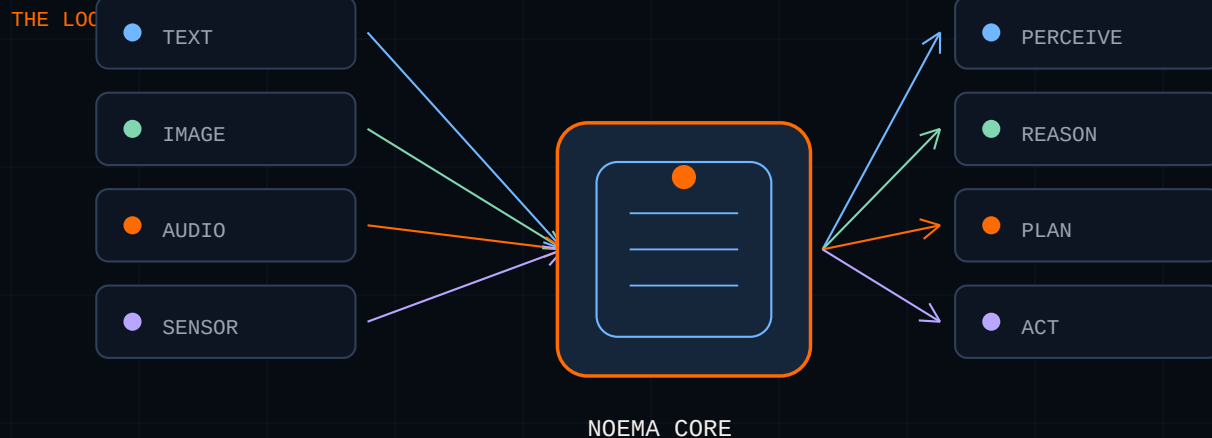

SOMA / EMBODIES

Noema

Intelligence that understands.

A multimodal intelligence layer for perception, representation, reasoning, planning and action. Noema turns language, images, audio and sensor context into decisions that can be evaluated in the real world.

● Grounded context

Build a structured view of the situation before a model decides what to do.

● Auditable reasoning

Keep tools, permissions, uncertainty and decisions inside a measurable loop.

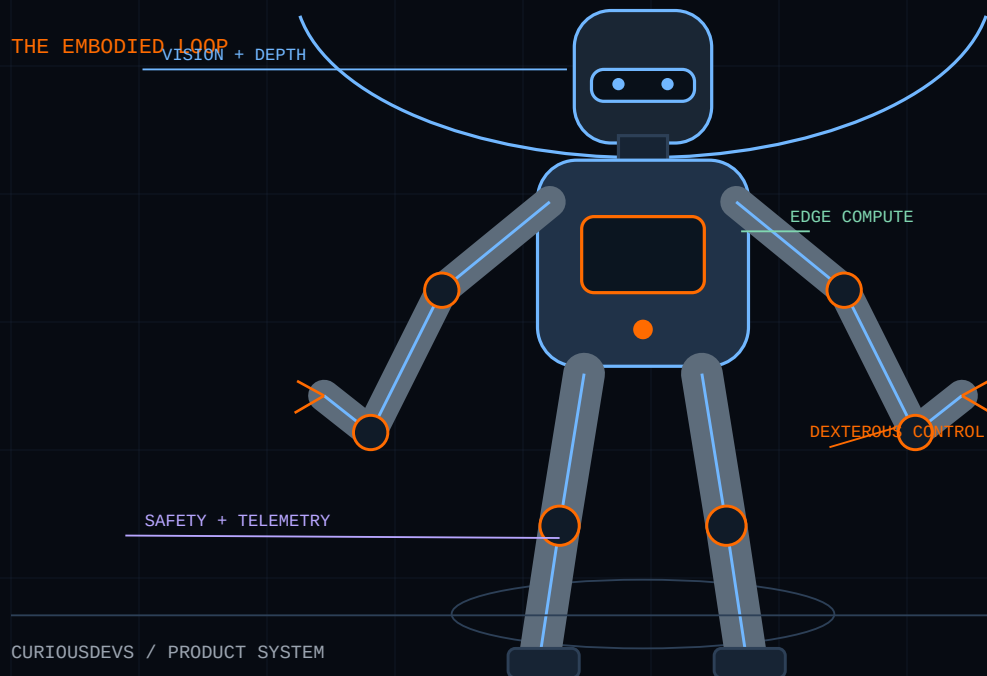

● Evaluation as a control surface

Measure task completion and failure modes, not just polished responses.

Soma

Intelligence, embodied.

A humanoid robotics platform designed to sense, understand, plan, move, act and adapt in real environments. Product direction spans perception, edge intelligence, safe control, dexterous manipulation and telemetry.

● Perception + depth

Vision, audio, inertial and environmental sensing create a live state estimate.

● Edge compute + control

Low-latency inference and hard safety limits keep decisions close to the machine.

● Action + learning

Motion, manipulation and deployment telemetry turn episodes into better skills.

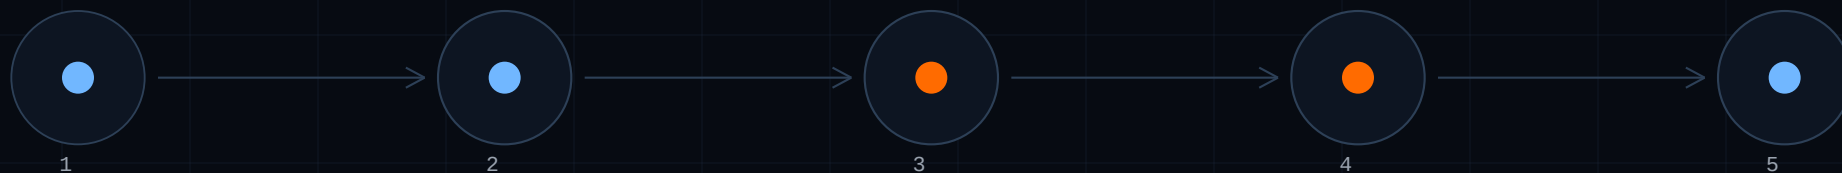

One intelligence stack.

Two product layers. One measured loop.

THE SAFETY BOUNDARY

Noema can propose. Soma can execute. Hard constraints, permissions, fallbacks and human override remain explicit at the boundary between decision and actuation.

Research to product. Without the gaps.

CuriousDevs connects ambitious research to systems that can be tested, deployed and operated. Every stage leaves behind evidence for the next.

OPERATING PRINCIPLE

Baseline before intervention.
Comparable evidence before claims.

Built for the real world.

Noema helps systems understand. Soma helps them act. Together they form a path from data to meaning, and from meaning to movement.

Build AI for production.
